

SILENT WAKE

Scenario Tutorial

Scenario Pack

February 2026

NAVAL
GROUP

1 Scenario outline

This tutorial structures Silent Wake as a 3-turn port approach that teaches the full turn cycle (inject -> discussion -> CO decision -> resolution) in a low-stakes setting before the main event.

Turn 1 frames a routine port approach with all systems nominal and no active concerns. Turn 1 best-play intent is to keep tempo while synchronizing the team (SWB01 + SWB03).

Turn 2 introduces a navigation offset from unexpected current plus VHF congestion degrading COMMS. Turn 2 guidance favors maintaining tempo while investigating the NAV anomaly (SWB01 + SWB07), with an investigation-plus-lookouts acceptable path.

Turn 3 presents a trade-off between a safer, wider approach and a faster, tighter one as the tide window narrows. Turn 3 best path emphasizes safety with reduced speed while maintaining mission tempo (SWB02 + SWB01).

2 Setting

Your frigate is approaching its home port after a routine patrol. You must complete the port entry before the tide window closes. Your time of arrival is crucial. Weather is fair, sea state calm, all systems nominal at departure.

3 Initial Conditions (Start of Turn 1)

Setup Reference

- Turn: 1
- Stress: 0
- Systems: NAV RADAR (Green, ON), IBMS / INS (incl. WECDIS) (Green, ON), NAV SENSORS (Green, ON), ASUW TRACKING RADAR (Green, OFF), COMMS (Green, ON), AAW RADAR (Green, OFF)
- Weapons: CIWS FWD (OK, OFF), CIWS AFT (OK, OFF), Missile Launcher (OK, OFF), Gun (OK, OFF), Decoys (OK, OFF)

4 Design Notes

- **Purpose:** Teach game mechanics before the main 15-turn scenario.
- **Scope:** 3 turns only. Different situation from main scenario (port approach, not open-water transit).
- **Cards used:** 6 cards total – SWB01, SWB02, SWB03, SWB05, SWB07, SWB19. All intuitive, no prerequisites, no once-per-game restrictions.
- **Stress range:** Stress stays between 0 and 2. S0 = 5:00, S1 = 4:50, S2 = 4:40. Discussion time stays generous while learning.

- **System degradation:** All systems start Green. At most COMMS reaches Yellow by end.
- **No combat, no cyber attribution ambiguity.**
- **Self-contained:** No references to or dependencies on the main scenario.

5 Cards Used

Card	Title	Available Turns
SWB01	Continue Mission	1, 2, 3
SWB02	Reduce Speed / Safer Nav	3
SWB03	Internal Sync (60 seconds)	1
SWB05	Increase Lookouts / Visual Confirm	2, 3
SWB07	Start Investigation	2
SWB19	Correct Course	3

6 Turn 1 – Steady Approach (teach: basic turn flow)

Facilitator says You are 20 nautical miles from port. Approach phase has begun. Port authority expects you within the hour.

Injects

- OPS: Port approach on schedule. Pilot boarding in 45 minutes. No updated traffic warnings.
- NAV: Course and speed steady at 12 kts. Channel approach bearing 270. Visibility good, ~15 nm.
- EO: All systems nominal. No open defects.
- CyOp: No alerts. Routine monitoring.
- AAWO: Air picture clear. No contacts of concern.
- PWO: Surface picture normal. Several merchant vessels in approach lane.

Blue options (up to 2 cards)

Best

Cards: SWB01 (Continue Mission) + SWB03 (Internal Sync (60 seconds)) Consequence: Stress +0, no system degradation. Remark: SWB05 (Increase Lookouts / Visual Confirm) could also be played here given the merchant traffic in the approach lane.

Acceptable

Cards: SWB01 (Continue Mission) only Consequence: Stress +1, no system degradation.

Notes

This turn is purely mechanical. Walk the team through each phase explicitly. Let them see the timer, see the board update, see the CO commit. Pause to explain anything unclear.

Board after turn: Stress 0, all Green.

7 Turn 2 – Unexpected Current (teach: system state change + investigation)

Facilitator says /

Injects

- NAV: GPS position and chart position show a 0.3 nm lateral offset. Ship appears to be drifting south of the planned approach track. Current stronger than forecast.
- EO: COMMS experiencing intermittent latency on port authority channel. Messages arriving with 10–15 second delays. Likely congestion on shared VHF frequency.
- OPS: Port authority has not acknowledged your last position report.

Blue options (up to 2 cards)**Best**

Cards: SWB07 (Start Investigation – NAV offset) Consequence: Stress +1. COMMS -> Yellow (delayed port coordination).

Acceptable

Cards: SWB01 (Continue Mission) + SWB07 (Start Investigation – COMMS or NAV offset) Consequence: Stress +1. COMMS -> Yellow.

Notes

Move COMMS to Yellow regardless of Blue action (external cause: VHF congestion). The NAV offset is real (current, not cyber) – investigation should confirm this quickly. This turn teaches: a system can degrade from external causes, and investigation reveals information. Stress +1 on best path teaches the stress-timer link.

Board after turn: Stress 0 or 1, COMMS Yellow. All other systems Green.

8 Turn 3 – Narrowing Window (teach: trade-off under time pressure)

Facilitator says Investigation confirms the lateral offset is caused by an unexpected tidal current. Your approach track needs correction. Port authority confirms: tide window closes in 30 minutes.

Injects

- NAV: Current correction calculated. Two options: maintain speed and correct course (tighter margins in channel), or reduce speed for a wider, safer approach (risks missing the tide window).
- EO: COMMS latency persists. Port authority responses still delayed.
- OPS: Pilot boat visible bearing 265, range 3 nm. Pilot boarding requires stable course and speed.

Blue options (up to 2 cards)

Best

Cards: SWB02 (Reduce Speed / Safer Nav) + SWB19 (Correct Course) Consequence: Stress -1. Safe approach with maintained tempo. COMMS remains Yellow.

Acceptable

Cards: SWB19 (Correct Course) + SWB01 (Continue Mission) Consequence: Stress +1. Faster but tighter margins – facilitator may note increased risk.

Notes

Both paths succeed, but the trade-off is clear: safer approach vs. tighter margins. Reward either choice with mission progress – the tutorial should end on a positive note. This turn teaches: not every decision has a wrong answer, but the team should articulate WHY they chose what they chose.

Board after turn: Stress 0-2, COMMS Yellow. All other systems Green.

9 End of Tutorial

The tutorial ends after Turn 3 resolution. The facilitator should confirm the final board state aloud and transition to the mini-AAR.
